SUBJECT: POINT BEACH UNIT 2 REACTOR UNPLANNED SHUTDOWN DUE TO CONTROL ROD DRIVE PROBLEMS (UPDATE)

DESCRIPTION:

On Monday, December 13, 2010, at 5:03 p.m. (Central Standard Time), the licensee shut down the Point Beach Unit 2 reactor because a periodic test to make sure the control rods will insert into the reactor to shut it down automatically, if necessary, could not be completed. One of the control rods failed to move the full range required by the test. Unit 1 remains at full power.

The licensee performed tests to identify the cause of the problem and tested all control rods to ensure they were operating properly in preparation for restarting the reactor. The licensee was unable to determine the cause of the problem. The testing of the control rods revealed they could insert into the reactor, as required. The NRC resident inspectors reviewed the licensee's actions and identified no concerns.

On Wednesday, December 15, 2010, at about 1:48 a.m., the licensee attempted to restart the reactor. As operators were moving control rods out of the reactor, most of the control rods automatically returned into the reactor. Control room operators then inserted the remaining rods. At that time, the reactor was still shut down. An NRC inspector was in the control room at the time of the attempted startup. He identified no problems with control room personnel performance and equipment response to the re-insertion of the control rods into the reactor.

The licensee completed extensive troubleshooting and testing of the rod control system to identify what caused the problems with the system. They found and corrected some electrical issues with two electrical cables with defective insulation and repaired or replaced numerous electronic circuit cards. On Tuesday, December 21, at 7:22 a.m., the licensee restarted the Unit 2 reactor without any rod control system problems and synchronized the unit to the offsite electrical distribution grid at 2:52 p.m. The NRC inspectors monitored the troubleshooting, testing, and repair activities, and the re-start of the reactor. No problems were identified by the inspectors with the licensee actions.

The State of Wisconsin has been informed.

This information has been reviewed with licensee management and is current as of 3:00 p.m., December 21, 2010.

ADAMS Accession Number ML103560054.
