

## **7.0 HISTORICAL DATA TABLES**

### Sample Statistics from Previous Environmental Sampling

The mean, minimum value and maximum value were calculated for selected sample mediums and isotopes.

#### Special Considerations:

1. Sample data listed as 1969 was taken from the NINE MILE POINT, PREOPERATION SURVEY, 1969 and ENVIRONMENTAL MONITORING REPORT FOR NIAGARA MOHAWK POWER CORPORATION NINE MILE POINT NUCLEAR STATION, NOVEMBER, 1970.
2. Sample results listed as 1974 and 1975 were taken from the respective Annual Radiological Environmental Operating Reports for Nine Mile Point Unit 1 Nuclear Station. Sample results listed as 1986 through the current year were taken from the respective Nine Mile point Nuclear Power Station Annual Radiological Environmental Operating Reports.
3. Only measured values were used for statistical calculations.

(a) Control location was at an area beyond the influence of the site (westerly direction).

(b) Sampling was initiated in 1979. Sampling was not required prior to 1979.

- (a) Indicator locations are down gradient wells located in the owner control area.
- (b) Required LLD changed to 500 pCi/l from 1000 pCi/l
- (c) Re-sample tritium concentration = <268 pCi/l

(a) Indicator locations were available downwind locations within ten miles of the site and with high radionuclide deposition potential.

(b) Data comprised of broadleaf and non-broadleaf vegetation (1976 – 1984, 2007 – 2009, 2011 & 2012).

(c) Data comprised of broadleaf vegetation only (1985 – 2006 & 2010).

## **8.0    QUALITY ASSURANCE / QUALITY CONTROL PROGRAM**

---

### **8.1    PROGRAM DESCRIPTION**

The Offsite Dose Calculation Manuals (ODCM), for Nine Mile Point Unit 1 (NMP1) and Nine Mile Point Unit 2 (NMP2), Part II, Section 4.0 requires that the licensee participate in an Interlaboratory Comparison Program. The Interlaboratory Comparison Program shall include sample media for which samples are routinely collected and for which comparison samples are commercially available. Participation in an Interlaboratory Comparison Program ensures that independent checks on the precision and accuracy of the measurement of radioactive material in the environmental samples are performed as part of the Quality Assurance Program for environmental monitoring. To fulfill the requirement for an Interlaboratory Comparison Program, the James A. FitzPatrick Nuclear Power Plant (JAFNPP) Environmental Laboratory has engaged the services of Eckert & Ziegler Analytics, Incorporated in Atlanta, Georgia.

Eckert & Ziegler Analytics supplies sample media as blind sample spikes, which contain certified levels of radioactivity unknown to the analysis laboratory. These samples are prepared and analyzed by the JAF Environmental Laboratory using standard laboratory procedures. Eckert & Ziegler Analytics issues a statistical summary report of the results. The JAFNPP Environmental Laboratory uses predetermined acceptance criteria methodology for evaluating the laboratory's performance.

The JAFNPP Environmental Laboratory also analyzes laboratory blanks. The analysis of laboratory blanks provides a means to detect and measure radioactive contamination of analytical samples. The analysis of analytical blanks also provides information on the adequacy of background subtraction. Laboratory blank results are analyzed using control charts.

## **8.2 PROGRAM SCHEDULE**

Vegetation	Mixed Gamma	2
<b>TOTAL SAMPLE INVENTORY</b>		<b>33</b>

## **8.3 ACCEPTANCE CRITERIA**

Each sample result is evaluated to determine the accuracy and precision of the laboratory's analysis result. The sample evaluation method is discussed below.

### **8.3.1 SAMPLE RESULTS EVALUATION**

Samples provided by Eckert & Ziegler Analytics are evaluated using what is specified as the NRC method. This method is based on the calculation of the ratio of results reported by the participating laboratory (QC result) to the Vendor Laboratory Known value (reference result).

An Environmental Laboratory analytical result is evaluated using the following calculation:

The value for the error resolution is calculated.

$$\text{The error resolution} = \frac{\text{Reference Result}}{\text{Reference Results Error (1 sigma)}}$$

Using the appropriate row under the Error Resolution column in Table 8.3.1 below, a corresponding Ratio of Agreement interval is given.

The value for the ratio is then calculated.

$$\text{Ratio} = \frac{\text{QC Result}}{\text{Reference Result}}$$

If the value falls within the agreement interval, the result is acceptable.

**TABLE 8.3.1**

<b>ERROR RESOLUTION</b>	<b>RATIO OF AGREEMENT</b>
< 4	No Comparison
4 to 7	0.5 to 2.0
8 to 15	0.6 to 1.66
16 to 50	0.75 to 1.33
51 to 200	0.8 to 1.25
>200	0.85 to 1.18

This acceptance test is generally referred to as the “NRC” method. The acceptance criteria are contained in Procedure S-ENVSP-12, Environmental Surveillance Program Quality Assurance/Quality Control Program and EN-CY-102, Laboratory Analytical Control. The NRC method generally results in an acceptance range of approximately  $\pm 25\%$  of the Known value when applied to sample results from the Eckert & Ziegler Analytics Interlaboratory Comparison Program. This method is used as the procedurally required assessment method and requires the generation of a deviation from QA/QC program report when results are unacceptable.

## **8.4 PROGRAM RESULTS SUMMARY**

The Interlaboratory Comparison Program numerical results are provided on Table 8-1.

### **8.4.1 ECKERT & ZIEGLER ANALYTICS QA SAMPLES RESULTS**

Thirty-three QA blind spike samples were analyzed as part of Eckert & Ziegler Analytics 2012 Interlaboratory Comparison Program. The following sample media were evaluated as part of the comparison program.

- Air Charcoal Cartridge: I-131
- Air Particulate Filter: Mixed Gamma Emitters, Gross Beta
- Water: I-131, Mixed Gamma Emitters, Tritium, Gross Beta
- Soil: Mixed Gamma Emitters
- Milk: I-131, Mixed Gamma Emitters
- Vegetation: Mixed Gamma Emitters

The JAFNPP Environmental Laboratory performed 135 individual analyses on the 33 QA samples. Of the 135 analyses performed, 133 were in agreement using the NRC acceptance criteria for a 98.5 % agreement ratio. The two (2) analyses not in agreement are discussed below.

There were two (2) non-conformities in the 2012 program.

#### **Eckert & Ziegler Analytics Sample E-10086, Water Gross Beta Corrective Action No. CR-JAF-2012-05041**

The JAF Environmental Lab result for the Eckert & Ziegler Analytics QA sample E-10086, water gross beta, was not in agreement with the known value. JAF reported an average value of 87.4 pCi/L when the known value was 285 pCi/L.

Three aliquots of the sample were prepared and 3 results were generated along with the mean which was reported. The sampling volume was not adjusted for the 3 aliquots. The incorrect sample volume was used to calculate the activity.

The volume used in the calculation of the activity was incorrectly entered as 0.5 L when the correct volume should have been 0.166 L. If the correct volume had been used, the activity would have been  $87.4 * 3 = 262.2$  pCi/L. The corrected activity would then have been in agreement with the known value.

Guidance was added to the Lab Policy Manual for calculating gross beta concentrations when more than 1 aliquot of the sample is taken.

**Eckert & Ziegler Analytics Sample E-10274, Water Gross Beta  
Corrective Action No. CR-JAF-2013-00770**

---

The JAF Environmental Lab result for the Eckert & Ziegler Analytics QA sample E-10274, water gross beta, was not in agreement with the known value. JAF reported an average value of 190.6 pCi/L when the known value was 251 pCi/L. The error resolution is 59.7 which equates to a ratio of agreement of 0.8 to 1.25. The JAF / known value was 0.76. The sample was analyzed on another instrument with an average result of 187.9 pCi/L.

The vendor was contacted and suggested recommendations have been examined and have not accounted for the discrepancy in the result.

JAF result performed on the previous Eckert & Ziegler water gross beta sample was in excellent agreement with the known value.
