CHAPTER 1 TABLE OF CONTENTS

CHAPTER 1 LIST OF TABLES

CHAPTER 1 LIST OF FIGURES

1.1 INTRODUCTION

This Site Safety Analysis Report (SSAR) supports Tennessee Valley Authority's (TVA's) Early Site Permit Application (ESPA) for the Clinch River Nuclear (CRN) Site. The SSAR addresses issues related to suitability of the CRN Site, in compliance with the regulations contained in 10 CFR 52, Subpart A, Early Site Permits. Specifically, the SSAR provides information related to site safety, emergency preparedness, and quality assurance.

The CRN Site is located in the City of Oak Ridge, Tennessee, and is the site of the former Clinch River Breeder Reactor Project. The CRN Site is comprised of approximately 935 acres, which are adjacent to the Clinch River arm of the Watts Bar Reservoir. TVA has not yet selected a reactor design to be constructed at the CRN Site; however, to facilitate the NRC's determination regarding suitability of the site for new nuclear units, TVA has provided a set of bounding plant parameters, referred to as the plant parameter envelope (PPE). The PPE was developed based on four small modular reactor (SMR) designs. An overview of the SMR designs used to develop the PPE is provided in Section 1.11, and Section 2.0 identifies the PPE and site characteristic values, which may be used as the basis for the NRC's determinations.

Where practicable, the SSAR section numbers correspond to those identified in NUREG-0800, *Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition* (SRP). Because the scope of an ESPA is reduced as compared to a Combined License Application (COLA), there are gaps in the numbering sequence of the SSAR. Maintaining SSAR section numbering consistent with the SRP facilitates future integration of the ESPA information with reactor design certification information during COLA development.

A summary of the contents of the SSAR is as follows:

- Chapter 1, *Introduction and General Description of the Plant*, provides a general site description, an overview of reactor technologies considered in the development of the PPE, and a summary of SSAR compliance with regulations and conformance with regulatory guidance. A list of acronyms, abbreviations, and initialisms pertinent to the SSAR is included as Table 1.1-1.

- Chapter 2, *Site Characteristics*, outlines the PPE and provides information related to geography and demography; hazards from nearby industrial, transportation, and military facilities (including aircraft hazards); and the meteorological, hydrologic, geologic, and seismic characteristics of the site.

- Chapter 3, *Design of Structures, Components, Equipment, and Systems*, references information on aircraft hazards provided in Section 2.2.

- Chapter 11, *Radioactive Waste Management*, provides the analysis of doses due to liquid and gaseous effluents from normal operations.

- Chapter 13, *Conduct of Operations*, provides emergency planning and industrial security information.

- Chapter 15, *Accident Analyses*, provides accident and dose consequence analyses required by 10 CFR 52.17(a)(1), 50.34(a)(1) and 100.21(c)(2), based on information provided in the PPE.

- Chapter 17, *Quality Assurance*, provides a description of the quality assurance program (QAP) under which the ESPA was prepared and the proposed Quality Assurance Program Description to address the requirements of 10 CFR 52.17(a)(1)(xi).

1.2 GENERAL SITE DESCRIPTION

1.2.1 Site Location

The Clinch River Nuclear (CRN) Site is located in Oak Ridge, Tennessee, and comprises approximately 935 acres of land adjacent to the Clinch River arm of the Watts Bar Reservoir. The CRN Site is the location of the former Clinch River Breeder Reactor Project. A more detailed description of the site location is provided in Section 2.1.

The site is bounded on the east, south, and west by the Clinch River arm of the Watts Bar Reservoir and on the north by the Grassy Creek Habitat Protection Area. Communities located near the site include Kingston (approximately 6.8 miles [mi] west), Harriman (9.2 mi west-northwest), Lenoir City (approximately 8.8 mi southeast), and Knoxville (approximately 25.6 mi east-northeast).

Figures 2.1-3 and 2.1-4 show the CRN Site location and the surrounding 5-mi vicinity and 50-mi region, respectively.

1.2.2 Site Development

TVA has not selected a reactor technology to be constructed at the CRN Site. Instead, a set of bounding plant parameter values has been identified, based upon the available information from various light-water-cooled, small modular reactor (SMR) designs. This set of bounding values, referred to as the plant parameter envelope (PPE), is presented in Section 2.0 and provides the basis for future site development at the CRN Site. The PPE is based on construction and operation at the CRN Site of two or more SMRs with a maximum rated thermal power for a single unit of 800 MWt. The combined nuclear generating capacity from the site is not to exceed 2420 MWt (800 MWe). Because a specific reactor technology has not been selected, an area, referred to as the “power block area,” has been proposed as the location of the reactor modules on the site. The CRN Site location is shown in Figure 1.2-1, while the general plant areas, including the power block area, are illustrated in Figure 1.2-2.

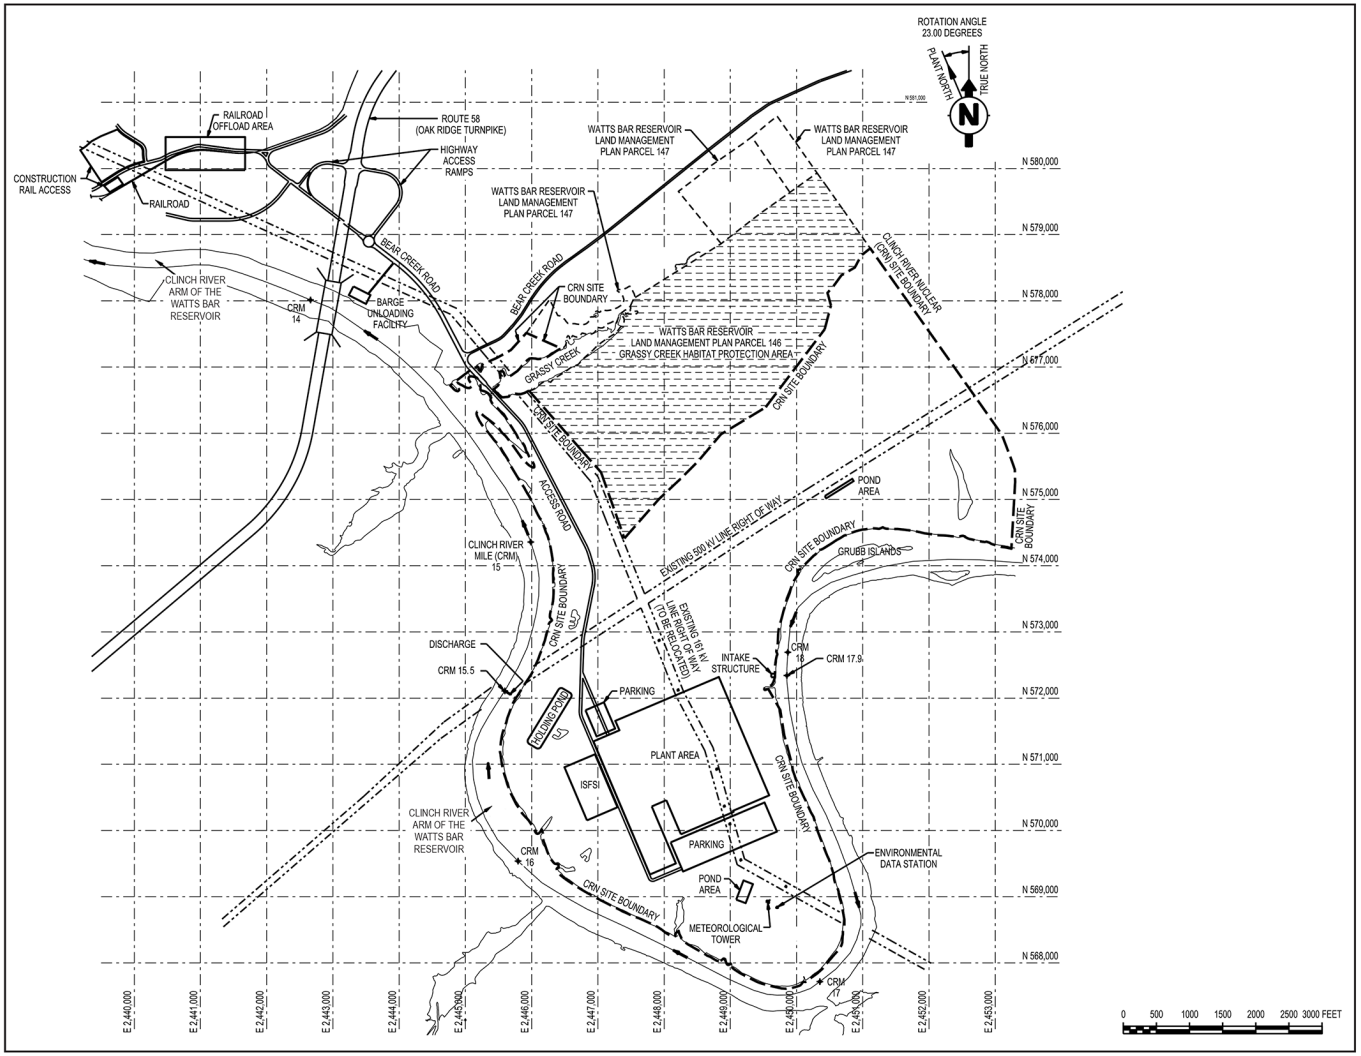

Figure 1.2-1. Clinch River Nuclear Site Location

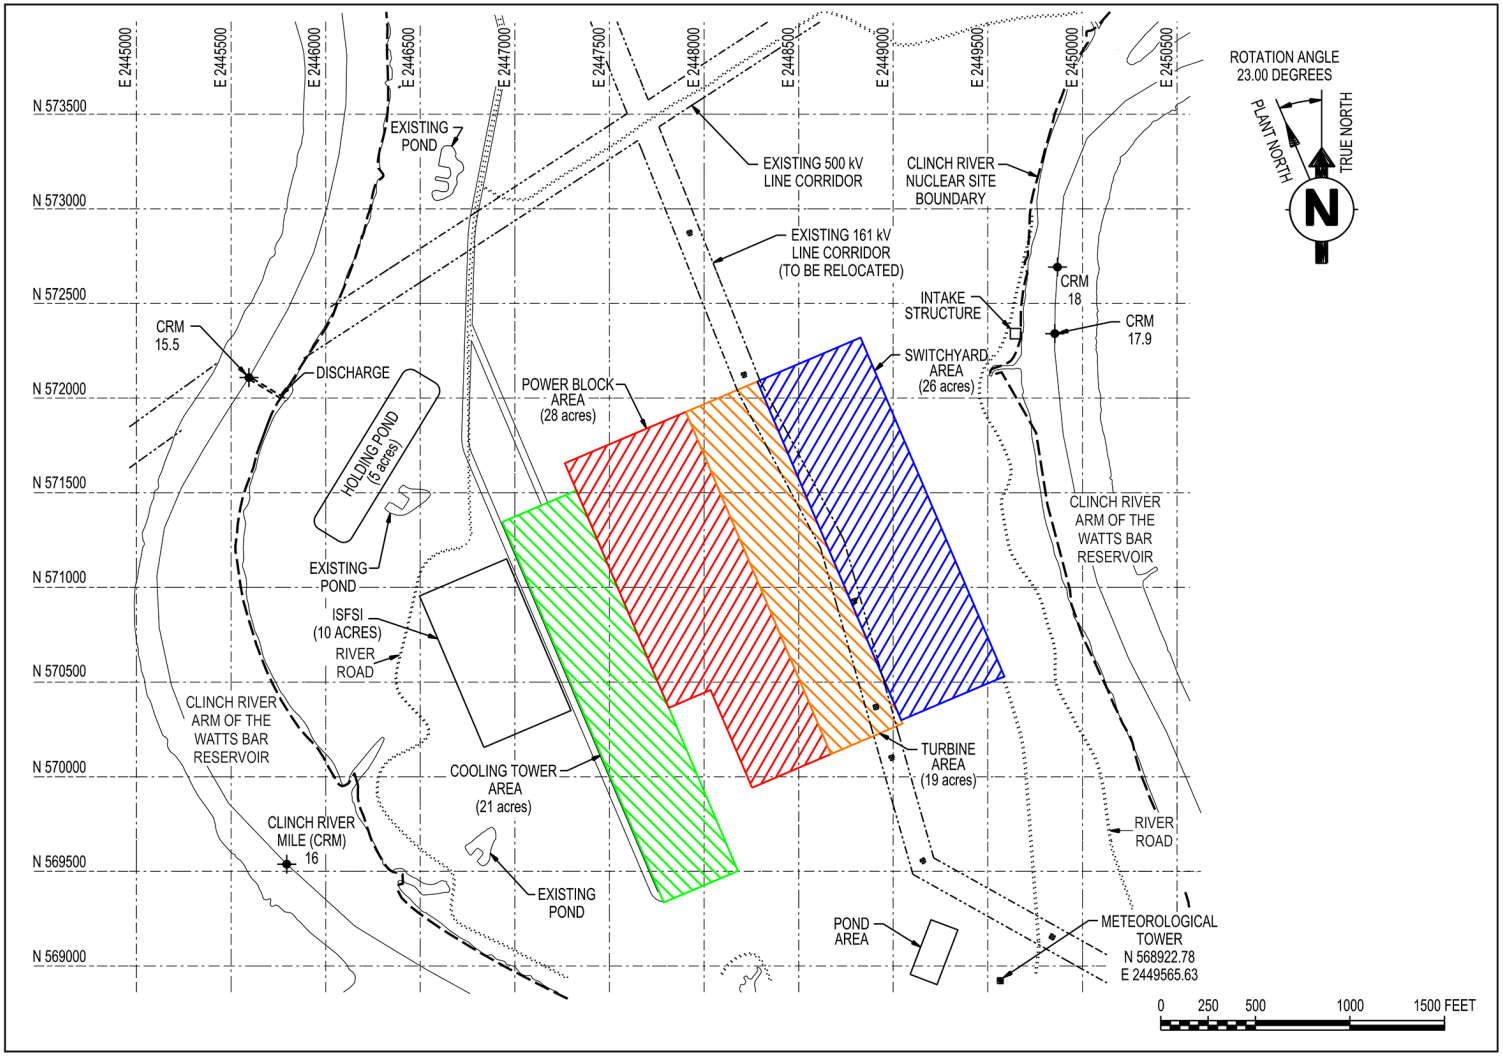

Figure 1.2-2. Clinch River Nuclear Site Plant Areas

1.3 COMPARISON WITH OTHER FACILITIES

This section is not applicable to an Early Site Permit Application using the plant parameter envelope approach.

1.4 IDENTIFICATION OF AGENTS AND CONTRACTORS

1.4.1 Applicant/Program Manager

The Tennessee Valley Authority (TVA) is the Applicant for an Early Site Permit (ESP) at the Clinch River Nuclear (CRN) Site. TVA is the United States' largest public power provider. It was established by Congress in 1933, among other things, to improve navigation on the Tennessee River, reduce the damage from destructive floodwaters within the Tennessee River system and downstream on the lower Ohio and Mississippi Rivers, further the economic development of TVA's service area, and sell the electricity generated at the facilities TVA operates. TVA's service territory, which includes most of Tennessee and parts of Alabama, Georgia, Kentucky, Mississippi, North Carolina, and Virginia, serves more than nine million people. TVA sells electricity to 155 local power company customers and directly serves approximately 52 large industrial facilities and 8 Federal facilities.

1.4.2 Principal Contractors and Participants

1.4.2.1 BWX Technologies, Inc.

TVA has a contract with BWX Technologies (BWXT) to provide technical information to TVA in support of the ESP Application (ESPA).

1.4.2.2 Generation mPower LLC

BWXT has contracted Generation mPower (GmP) to manage development of portions of the ESPA.

1.4.2.3 Bechtel Power Corporation

Bechtel Power Corporation assisted in developing portions of the Site Safety Analysis Report (SSAR) and conducted various analyses and investigations, including:

- Geotechnical field investigations, with contracted support from Amec Foster Wheeler
- Identification and characterization of seismic source zones, with contracted support from Lettis Consultants International
- Determination of site-specific distribution coefficients, with contracted support from Argonne National Laboratory

1.4.2.4 Other Contractors and Participants

Contractual relationships were established between TVA and specialized consulting firms to assist in preparation of the ESPA for the CRN Site, as discussed in the following subsections.

1.4.2.4.1 Barge Waggoner Sumner & Cannon, Inc.

TVA contracted Barge Waggoner Sumner & Cannon, Inc., to perform evaluations and studies in the area of hydrology.

1.4.2.4.2 Enercon Services, Inc.

TVA contracted Enercon Services, Inc., to prepare portions of the SSAR related to demography and meteorology and to develop the Emergency Plans.

1.4.2.4.3 AECOM Technical Services Inc.

TVA contracted AECOM Technical Services, Inc., to perform a portion of the seismic analyses.

1.5 REQUIREMENTS FOR ADDITIONAL TECHNICAL INFORMATION

No technical development programs remain to be performed to support this application.

1.6 MATERIAL REFERENCED

No material has been incorporated by reference in this application.

1.7 DRAWINGS AND OTHER DETAILED INFORMATION

No such information has been submitted separately as part of this application.

1.8 INTERFACES WITH STANDARD DESIGN

This topic is not applicable to an Early Site Permit Application using the plant parameter envelope approach and is addressed at the combined license application stage.

1.9 CONFORMANCE WITH REGULATORY CRITERIA

This section addresses the conformance of the Site Safety Analysis Report (SSAR) with applicable NRC guidance contained in NRC Regulatory Guides (RGs) and NUREG-0800, *Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition* (SRP).

NRC RGs evaluated for conformance were identified through a review of the applicable SRP sections. Table 1.9-1 provides a listing of applicable RGs by number and title with the associated SSAR section number statements of conformance. Exceptions to conformance with a RG are noted with an explanation. RGs included are those identified in the applicable SRP sections.

Table 1.9-2 provides a listing of the SRP sections, applicable to an Early Site Permit Application (ESPA), with statements of conformance. An exception to conformance is noted when the SSAR does not meet regulatory guidance as stated but the intent or objective is met using an acceptable alternative. Exceptions to conformance with the SRP are noted with an explanation.

Exemptions to NRC regulations required to support this ESPA are identified and described in ESPA Part 6.

			13.3	Exception	Part 5A: TVA is requesting an exemption from certain elements of 10 CFR 50.33(g) and 10 CFR 50.47(c)(2) as they relate to the size of the Plume Exposure Pathway Emergency Planning Zone (EPZ). The Plume Exposure Pathway EPZ for the CRN Site described in Part 5A is at the site boundary. Part 5B: TVA is requesting an exemption from certain elements of 10 CFR 50.33(g) and 10 CFR 50.47(c)(2) as they relate to the size of the Plume Exposure Pathway EPZ. The Plume Exposure Pathway EPZ for the CRN Site described in Part 5B is about 2 miles.
			13.3.3.2	NA	The ingestion exposure pathway EPZ for the CRN Site will be described in the COLA.
5.62	1	Reporting of Safeguards Events	13.3	Conforms	

(a) NA = Not applicable
(b) Revision 3 of Regulatory Guide 1.138 was issued in December of 2014; however, the subsurface investigation for the CRN Site was conducted between June 2013 and March 2014, using the information in Regulatory Guide 1.138 in effect at that time (Revision 2).

Table 1.9-2 (Sheet 1 of 6)
Conformance with Standard Review Plan

Section of NUREG-0800	Rev.	Title	Applicable SSAR Section(s)	Conformance[a]	Comments
1.0	2	Introduction and Interfaces	1.1–1.11	Conforms	Supplementary information related to reactor design and construction is addressed in the COLA, when a vendor has been selected.
2.0	0	Site Characteristics and Site Parameters	2.0	Conforms	
2.1.1	3	Site Location and Description	2.1.1	Conforms	
2.1.2	3	Exclusion Area Authority and Control	2.1.2	Conforms	
2.1.3	3	Population Distribution	2.1.3	Conforms	
2.2.1–2.2.2	3	Identification of Potential Hazards in Site Vicinity	2.2.1–2.2.2	Conforms	
2.2.3	3	Evaluation of Potential Accidents	2.2.3	Conforms	The locations, quantities, and effects of chemicals to be stored onsite are addressed in the COLA. Evaluations of the impacts of toxic gases on main control room habitability are addressed in the COLA.
2.3.1	3	Regional Climatology	2.3.1	Conforms	
2.3.2	3	Local Meteorology	2.3.2	Conforms	
2.3.3	3	Onsite Meteorological Measurements Programs	2.3.3	Conforms	
2.3.4	3	Short Term Dispersion Estimates for Accident Releases	2.3.4	Conforms	Control room dispersion estimates are addressed in the COLA.
2.3.5	3	Long-Term Atmospheric Dispersion Estimates for Routine Releases	2.3.5	Conforms	
2.4.1	3	Hydrologic Description	2.4.1	Conforms	The Tennessee River System, including the Clinch River arm of the Watts Bar Reservoir, is a regulated and fully developed system. Surges, seiches, tsunami, flooding caused by landslides and effects of ice formation are not credible for the CRN Site.
2.4.2	4	Floods	2.4.2	Conforms	The Tennessee River System, including the Clinch River arm of the Watts Bar Reservoir, is a regulated and fully developed system. Surges, seiches, tsunami, flooding caused by landslides and effects of ice formation are not credible for the CRN Site.
2.4.3	4	Probable Maximum Flood (PMF) on Streams and Rivers	2.4.3	Conforms	

Table 1.9-2 (Sheet 2 of 6)
Conformance with Standard Review Plan

Section of NUREG-0800	Rev.	Title	Applicable SSAR Section(s)	Conformance[(a)]	Comments
2.4.4	3	Potential Dam Failures	2.4.4	Conforms	Design of structures is addressed in the COLA.
2.4.5	3	Probable Maximum Surge and Seiche Flooding	2.4.5	Conforms	These events are not credible for the site because of its location, reservoir characteristics, and site history.
2.4.6	3	Probable Maximum Tsunami Hazards	2.4.6	Conforms	There are no tsunami-induced flooding hazards expected at the CRN Site. Because the conditions at the site are not conducive to the creation of a tsunami, no propagation model has been developed and wave runup, inundation, and drawdown are not separately addressed.
2.4.7	3	Ice Effects	2.4.7	Conforms	No safety-related SSCs are subject to ice-induced forces or blockages from sheet or frazil ice.
2.4.8	3	Cooling Water Canals and Reservoirs	2.4.8	Conforms	The CRN Site does not include cooling water canals or reservoirs.
2.4.9	3	Channel Diversions	2.4.9	Conforms	Requirements for alternative water sources are addressed in the COLA, when a reactor technology has been selected.
2.4.10	3	Flooding Protection Requirements	2.4.10	Conforms	Based upon grade elevation and maximum flooding height, the site is considered to be “dry”; however, the need for flood protections is addressed in the COLA when detailed grading and reactor design are available. Local PMP is addressed in the COLA, when detailed grading and reactor design are available.
2.4.11	3	Low Water Considerations	2.4.11	Conforms	
2.4.12	3	Groundwater	2.4.12	Conforms	Groundwater is not used for safety-related purposes. The need for dewatering systems is addressed in the COLA.
2.4.13	3	Accidental Releases of Radioactive Liquid Effluents in Ground and Surface Waters	2.4.13	Conforms	
2.4.14	3	Technical Specifications and Emergency Operation Requirements	2.4.14	Conforms	The site is considered to be “dry” and does not require a safety-related source of water. By design, no emergency actions or Technical Specifications are required. Conformance with the general design criteria is not applicable to ESPAs.
2.5.1	5	Basic Geologic and Seismic Information	2.5.1	Conforms	

Table 1.9-2 (Sheet 3 of 6)
Conformance with Standard Review Plan

Section of NUREG-0800	Rev.	Title	Applicable SSAR Section(s)	Conformance[(a)]	Comments
2.5.2	5	Vibratory Ground Motion	2.5.2	Conforms	A sensitivity analysis was performed to evaluate the impact of the consideration of overburden on GMRS.
2.5.3	5	Surface Faulting	2.5.3	Conforms	
2.5.4	5	Stability of Subsurface Materials and Foundations	2.5.4	Conforms	Profiles illustrating the detailed relationship between the foundation and subsurface materials is provided in the COLA. While the foundation depth is provided, remaining information (e.g., information related to backfill and borrow) are provided in the COLA.
2.5.5	5	Stability of Slopes	2.5.5	Conforms	Site grading are developed and stability of any safety-related slopes are addressed in the COLA.
3.5.1.6	4	Aircraft Hazards	3.5.1.6	Conforms	
11.2	4	Liquid Waste Management System	11.2.3	Conforms	Information related to design is addressed in the COLA.
11.3	3	Gaseous Waste Management System	11.3.3	Conforms	Information related to design is addressed in the COLA.
13.3	3	Emergency Planning	13.3	Exception	SRP Criterion 1: Part 5A: TVA is requesting exemptions from certain elements of 10 CFR 50.47(b)(4)–(6), (9) and (10) and 10 CFR 50, Appendix E F.2, F.2.a, F.2.a(i)–(iii), and F.2.b-d as they relate to offsite emergency planning. SRP Criterion 2: Part 5A: TVA is requesting exemptions from certain elements of 10 CFR 50.47(b)(4)–(6), (9) and (10) and 10 CFR 50, Appendix E F.2, F.2.a, F.2.a(i)–(iii), and F.2.b–d as they relate to offsite emergency planning. SRP Criterion 3: Certain aspects of the technology-specific Emergency Action Levels (EALs) required by 10 CFR 50.47(b)(4) and 10 CFR 50 Appendix E Section IV.B are addressed in the COLA. An EAL scheme consistent with industry standards developed to address SMR technology will be adopted.

Table 1.9-2 (Sheet 4 of 6)
Conformance with Standard Review Plan

Section of NUREG-0800	Rev.	Title	Applicable SSAR Section(s)	Conformance[(a)]	Comments
					SRP Criteria 4–6: Not applicable SRP Criterion 7: Due to the Site Boundary EPZ, onsite and offsite protective measures are being implemented in an ad hoc manner. Protective Action Recommendation (PAR) logic and PAR logic diagrams for the CRN Site are addressed and added to the Emergency Plan in the COLA. SRP Criterion 9: FEMA evaluations are beyond the scope of the Emergency Plan. SRP Criterion 10: TVA is requesting exemptions from certain elements of 10 CFR 50.33(g) and 10 CFR 50.47(c)(2) as they relate to EPZ sizing. The EPZ for the CRN Site described in Part 5A is at the site boundary. The EPZ for the CRN Site described in Part 5B is about 2 miles. SRP Criterion 11: Part A: TVA is requesting exemptions from certain elements of 10 CFR 50, Appendix E, IV.2–IV.7 as they relate to Evacuation Time Estimates (ETEs). Due to the Site Boundary EPZ, an ETE is not being performed. Part B: In Part 6 of the ESPA, TVA is requesting exemptions from certain elements of 10 CFR 50.33(g) and 10 CFR 50.47(c)(2) as they relate to EPZ sizing. The EPZ for the CRN Site described in Part 5B is 2 miles. An ETE has been performed for the 2-mile EPZ.

Table 1.9-2 (Sheet 5 of 6)
Conformance with Standard Review Plan

Section of NUREG-0800	Rev.	Title	Applicable SSAR Section(s)	Conformance[(a)]	Comments
					SRP Criterion 12: Not applicable SRP Criterion 13: TVA is submitting an ESPA. The requirements of 10 CFR 50.47(b) and 10 CFR 50.47(d) are satisfied in the COLA. SRP Criterion 14: Not applicable SRP Criterion 16: Part A: TVA is requesting exemptions from certain elements of 10 CFR 50, Appendix E, IV.2–IV.7 as they relate to ETEs. Due to the Site Boundary EPZ, an ETE is not being performed. Part B: In Part 6 of the ESPA, TVA is requesting exemptions from certain elements of 10 CFR 50.33(g) and 10 CFR 50.47(c)(2) as they relate to EPZ sizing. The EPZ for the CRN Site described in Part 5B is 2 miles. An ETE has been performed for the 2-mile EPZ. SRP Criterion 19: Part A: TVA is requesting exemptions from certain elements of 10 CFR 50.47(b)(5) and 10 CFR 50, Appendix E, D, D.3, and D.4 as they relate to notification measures and procedures regarding notifications to the public. Part B: The CRN Site Alert and Notification System is being developed and implemented consistent with a Federal Emergency Management Agency (FEMA) approved design.

Table 1.9-2 (Sheet 6 of 6)
Conformance with Standard Review Plan

Section of NUREG-0800	Rev.	Title	Applicable SSAR Section(s)	Conformance[(a)]	Comments
					SRP Criterion 20: For the ESPA, Parts 5A and 5B are being submitted as major features Emergency Plans in accordance with 10 CFR 52.17(b)(2)(i). SRP Criteria 21–24: Inspections, Tests, Analyses, and Acceptance Criteria (ITAAC) are developed and submitted in the COLA. SRP Criteria 25–29: Not applicable SRP Criterion 31: Emergency Plans Parts 5A and 5B are being submitted as part of an ESPA.
13.6.3	1	Physical Security - Early Site Permit	13.6	Conforms	
15.0.3	0	Design Basis Accident Radiological Consequences of Analyses for Advanced Light Water Reactors	15	Conforms	
17.5	1	Quality Assurance Program Description - Design Certification, Early Site Permit and New License Applicants	17.5	Exception	The CRN ESP Quality Assurance Program utilizes the TVA Nuclear Quality Assurance Program (TVA-NQA-PLN89-A), as supplemented by Appendices K, L, and M, to provide equivalents and alternatives to the implementing documents endorsed in RG 1.28, Revision 4. As discussed in Section 17.5, this approach provides an acceptable alternative to conforming to the guidance in NUREG-0800, Section 17.5, for compliance with the requirements of 10 CFR 50, Appendix B.

(a) NA = Not applicable

1.10 IMPACT OF CONSTRUCTION OF NEW NUCLEAR POWER PLANT UNITS ON OPERATING UNITS AT MULTI-UNIT SITES

This topic is not applicable to this Early Site Permit Application and is addressed at the combined license application stage.

1.11 OVERVIEW OF REACTOR TYPES

Four conceptual, light-water cooled, small modular reactor (SMR) designs were used to create a "surrogate plant" as defined in NEI 10-01, *Industry Guideline for Developing a Plant Parameter Envelope in Support of an Early Site Permit* (Reference 1.11-1) and to develop the site-related design parameter values listed in Table 2.0-2 of Chapter 2. A basis summary for each plant parameter is typically provided in the SSAR section indicated in Table 2.0-2 for that plant parameter. The reactor designs are:

- BWXT mPower™ (Generation mPower LLC design)
- NuScale (NuScale Power, LLC, design)
- SMR-160 (Holtec SMR, LLC, design)
- Westinghouse SMR (Westinghouse Electric Company, LLC, design)

All four designs are described as passively safe with minimal or no reliance on offsite power, offsite water, or operator action for safety. Based on design features, these designs eliminate various conventional design basis events (e.g., large-break LOCAs precluded by elimination of large bore piping). All four designs are integral pressurized water reactors (iPWRs); that is, pressurized water reactor (PWR) designs in which the primary coolant system and all (or most) of its components (i.e., pressurizer, steam generators, and reactor coolant pumps, where applicable) are enclosed in one pressure vessel.

1.11.1 BWXT mPower™

The BWXT mPower™ SMR is an advanced iPWR that generates 530 MWt, with an estimated power output of 180 MWe. The mPower reactor uses standard PWR fuel with a shorter fuel assembly length. The iPWR is located in a below-grade containment.

The mPower SMR is designed to be built in multiples of two reactors per plant, and up to two plants (four reactors) would be placed on the CRN Site.

1.11.2 NuScale

The NuScale SMR is an advanced iPWR that generates 160 MWt, with an estimated power output of 50 MWe. The NuScale SMR uses standard light water reactor fuel with a shorter fuel assembly length. The reactor sits within a containment vessel, and up to 12 reactors can be housed in one below-grade shared pool.

The NuScale SMR is a multi-unit configuration that is designed to include up to 12 reactors per plant, and up to 12 reactors would be placed on the CRN Site.

1.11.3 SMR-160

The Holtec Inherently-Safe Modular Underground Reactor (HI-SMUR™) SMR-160 is an iPWR that generates 525 MWt, with an estimated power output of 160 MWe. This reactor design does not use standard fuel. Instead, it uses a unitary cartridge containing all fuel that is replaced entirely each refueling. The reactor, steam generator, and spent fuel pool are located inside the containment structure. The reactor core is located below grade.

Each unit is built as a stand alone plant, and up to four SMR-160 reactors would be placed on the CRN Site.

1.11.4 Westinghouse SMR

The Westinghouse SMR is an advanced iPWR that generates 800 MWt, with an estimated power output of 225 MWe. The Westinghouse SMR uses standard PWR fuel, with a shorter fuel assembly length. The iPWR vessel is housed in a containment located below grade.

Each unit is built as a stand-alone plant, and up to three Westinghouse SMRs would be placed on the CRN Site.
